On the cover: Epicardial cells adopt fat cell fate after myocardial infarction. Immunostaining of lineage tracing marker of epicardium-derived cells (RFP), adipocyte marker (perilipin, PLN), and nuclei dye DAPI (white) on *Wt1-CreER;Rosa26^{RFP/+}* heart section. Magnification is $\times 400$. RFP⁺PLIN⁺ cells in the thickened epicardial layers of the infarcted region of the heart provide evidence of epicardium-to-fat transition.
