

Supplementary Figure 1 Linkage disequilibrium structure of a 41 kb region spanning ESR1 intron 1 – intron 2 in African American controls (n=635), determined using the solid spine of LD option of Haploview, with blocks extended if pairwise $D' > 0.80$. D' values are displayed in the squares. Empty red squares have a pairwise $D' = 1.00$. Red squares indicate high pairwise LD, gradually coloring down to white squares of low pairwise LD. Blue squares indicate high LD, but low significance.
