On the cover: A confocal micrograph of mouse kidney transplanted with human insulin- (green), glucagon- (red), and somatostatin- (pink) producing islet-derived cells with nuclei stained in blue. Transplantation of in vitro–derived islet-like cell clusters is a standard procedure for functional assessment of insulin-producing cells. Image obtained by Anandwardhan A. Hardikar and Mugdha V. Joglekar, School of Medicine, Western Sydney University, Sydney, Australia.
